# MIXED LADDER DETERMINANTAL VARIETIES FROM TWO-SIDED LADDERS 

ELISA GORLA

#### Abstract

We study the family of ideals defined by mixed size minors of two-sided ladders of indeterminates. We compute their Gröbner bases with respect to a skewdiagonal monomial order, then we use them to compute the height of the ideals. We show that these ideals correspond to a family of irreducible projective varieties, that we call mixed ladder determinantal varieties. We show that these varieties are arithmetically Cohen-Macaulay. Our main result consists in proving that mixed ladder determinantal varieties belong to the same G-biliaison class of a linear variety.

## Introduction

In this paper we study the G-biliaison class of a family of varieties, whose defining ideals are generated by minors of a matrix of indeterminates. Other families of schemes defined by minors have been studied in the same contest. The results obtained in this paper are related in a very natural way to some of the results proven in [7], [6], and [5]. In [7] Kleppe, Migliore, Miró-Roig, Nagel, and Peterson proved that standard determinantal schemes are glicci, i.e. that they belong to the G-liaison class of a complete intersection. We refer to [8] for the definition of standard and good determinantal schemes, and to [9] for a comprehensive treatment of liaison theory. Hartshorne showed in [6] that the double G-links produced in [7] can indeed be regarded as G-biliaisons. Hence, standard determinantal schemes belong to the G-biliaison class of a complete intersection. In [5] we defined symmetric determinantal schemes as schemes whose saturated ideal is generated by the minors of size $t \times t$ of an $m \times m$ symmetric matrix with polynomial entries, and whose codimension is maximal for the given $t$ and $m$. In the same paper we proved that these schemes belong to the G-biliaison class of a complete intersection. In this paper we prove that mixed ladder determinantal varieties belong to the G-biliaison class of a linear variety, hence they are glicci.

In Section 1 we define mixed ladder determinantal ideals and varieties. In order to prove irreducibility and Cohen-Macaulayness of these varieties, we use some standard Gröbner bases techniques that were used e.g. in [10], [HT92], [3], and [4]. In Theorem 1.10 we compute a Gröbner basis of a mixed ladder determinantal ideal with respect to a skew-diagonal monomial order. In Theorem 1.18 we show that mixed ladder determinantal ideals are irreducible. Hence they define irreducible varieties. In Theorem 1.21 we prove that mixed ladder determinantal varieties are arithmetically Cohen-Macaulay.

[^0]In Theorems 1.14 and 1.15 we compute the codimension of a mixed ladder determinantal variety by producing subsets of the ladder, whose cardinality agrees with the codimension of the variety.

In Section 2 we use the results that we obtained in Section 1 in order to show that a mixed ladder determinantal variety can be obtained from a linear variety by a series of ascending G-biliaisons. The explicit biliaisons are produced in the proof of Theorem 2.1. They take place on suitable mixed ladder determinantal varieties. In Corollary 2.2 we conclude that mixed ladder determinantal varieties are glicci.

## 1. Mixed ladder determinantal ideals and varieties

Let $V$ be a variety in $\mathbb{P}^{r}=\mathbb{P}_{K}^{r}$, where $K$ is an algebraically closed field. By variety we mean a reduced (not necessarily irreducible) scheme. We denote by $I_{V}$ the radical ideal associated to $V$ in the coordinate ring of $\mathbb{P}^{r}$. Let $\mathcal{I}_{V} \subset \mathcal{O}_{\mathbb{P}^{r}}$ be the ideal sheaf of $V$. Let $W$ be a variety containing $V$. We denote by $\mathcal{I}_{V \mid W}$ the ideal sheaf of $V$ restricted to $W$, i.e. the quotient sheaf $\mathcal{I}_{V} / \mathcal{I}_{W}$. We let $H_{*}^{0}(\mathcal{I})=\oplus_{s \in \mathbb{Z}} H^{0}\left(\mathbb{P}^{r}, \mathcal{I}(s)\right)$ denote the 0-th cohomology module of the sheaf $\mathcal{I}$.

In this paper we deal with ideals generated by minors of a matrix of indeterminates, and with the varieties that they cut out.

Notation 1.1. Let $X$ be an $m \times n$ matrix of indeterminates,

$$
X=\left[\begin{array}{ccc}
x_{1,1} & \cdots & x_{1, n} \\
\vdots & & \vdots \\
x_{m, 1} & \cdots & x_{m, n}
\end{array}\right]
$$

We assume that $m \leq n$.
Fix a choice of row indexes $1 \leq i_{1} \leq i_{2} \leq \ldots \leq i_{t} \leq m$ and of column indexes $1 \leq j_{1} \leq j_{2} \leq \ldots \leq j_{t} \leq n$. We denote by $X_{i_{1}, \ldots, i_{t} ; j_{1}, \ldots, j_{t}}$ the determinant of the $t \times t$ submatrix of $X$ consisting of the rows $i_{1}, \ldots, i_{t}$ and of the columns $j_{1}, \ldots, j_{t}$. If all the entries involved in the minor $X_{i_{1}, \ldots, i_{t} ; j_{1}, \ldots, j_{t}}$ belong to a subset $L$ of $X$, then we also write $L_{i_{1}, \ldots, i_{t} ; j_{1}, \ldots, j_{t}}$ for $X_{i_{1}, \ldots, i_{t} ; j_{1}, \ldots, j_{t}}$.

We are interested in the study of the ideals generated by minors that involve indeterminates contained in a subladder of $X$. We refer the reader to [2] for information about ladders and ladder determinantal ideals.

Definition/Notation 1.2. Let $L \subseteq X$ be a ladder. We say that $L$ is a ladder if it has the following property: whenever $x_{i, j}, x_{k, l} \in L$ and $i \leq k, j \geq l$, then $x_{i, l}, x_{k, j} \in L$. In other words, a ladder has the property that whenever the skew diagonal of a submatrix is a subset of the ladder, then all the indeterminates in the submatrix belong to the ladder. Given $1=b_{1}<b_{2}<\cdots<b_{h} \leq m, 1 \leq a_{1}<\cdots<a_{h}=n, 1 \leq d_{1} \leq \cdots \leq d_{k}=m$, and $1=c_{1} \leq c_{2} \leq \cdots \leq c_{k} \leq n$, we let

$$
L=\left\{x_{b, a} \mid b_{i} \leq b \leq m, 1 \leq a \leq a_{i}, 1 \leq b \leq d_{j}, c_{j} \leq a \leq n, \text { for some } i, j\right\}
$$

We call $\left(b_{1}, a_{1}\right), \ldots,\left(b_{h}, a_{h}\right)$ the upper outside corners, and $\left(d_{1}, c_{1}\right), \ldots,\left(d_{k}, c_{k}\right)$ the lower outside corners of $L$. We allow to have more than one lower outside corner on the same row or column. However, we assume that all the lower outside corners are distinct. We assume that no two upper outside corners belong to the same row or to the same column. Since the only function of the upper outside corners is to delimit the ladder, the assumption that no two belong to the same row or column is not restrictive.

We include the possibility that $L=X$, i.e. a matrix is a ladder. We say that a ladder is one-sided if all its lower outside corners belong to the first column or to the last row. Alternatively, a ladder with arbitrary lower outside corners is one-sided if it has exactly one upper outside corner. We regard a matrix as a one-sided ladder.

We let

$$
L_{j}=\left\{x_{b, a} \in L \mid 1 \leq b \leq d_{j}, c_{j} \leq a \leq n\right\}
$$

Then $L=\cup_{j=1}^{k} L_{j}$. Each $L_{j}$ is a one-sided ladder, with unique lower outside corner $\left(d_{j}, c_{j}\right)$. $L_{j}$ has upper outside corners $\left(b_{l_{j}}, a_{l_{j}}\right), \ldots,\left(b_{h_{j}}, a_{h_{j}}\right)$, where

$$
l_{j}=\min \left\{i \mid x_{b_{i}, a_{i}} \in L_{j}\right\} \quad \text { and } \quad h_{j}=\max \left\{i \mid x_{b_{i}, a_{i}} \in L_{j}\right\} .
$$

Notice that $L_{j}$ is a subladder of

$$
X_{j}=\left\{x_{b, a} \in X \mid b_{l_{j}} \leq b \leq d_{j}, c_{j} \leq a \leq a_{h_{j}}\right\}
$$

Moreover, $X_{j}$ is the smallest submatrix of $X$ containing $L_{j}$.
We study ideals generated by minors of a ladder of indeterminates. For a given matrix $X$ and a ladder $L$, we denote by $I_{t}(L)$ the ideal generated by the $t \times t$ minors of $X$ whose entries belong to $L$. We call $I_{t}(L)$ a ladder determinantal ideal. Let $K[L]$ denote the $K$-algebra generated by the entries of $L$. Then $I_{t}(L) \subseteq K[L]$. Narasimhan showed in [10] that these ideals are prime, hence they define irreducible projective varieties.

Definition 1.3. Let $X$ be a matrix of indeterminates, let $L \subseteq X$ be a ladder. Fix a positive integer $t$. We call ladder determinantal variety a variety with ideal $I_{t}(L)$. We regard it as a subvariety of $\mathbb{P}^{r}=\operatorname{Proj}(K[L])$.

As in [4], we extend the definition of ladder determinantal ideal to allow minors of different size in different regions of the ladder. In the paper of Gonciulea and Miller, they call mixed ladder determinantal varieties those corresponding to mixed ladder determinantal ideals coming from one-sided ladders. Moreover, they assume that no two consecutive outside corners belong to the same row or column (notice that their upper corners correspond to our lower corners, and viceversa). In this paper we drop both of those assumptions, so we deal with a larger family of varieties than in [4].

Definition 1.4. Let $X$ be a matrix of indeterminates, let $L \subseteq X$ be a ladder as in Definition 1.2. Fix a vector of positive integers $t=\left(t_{1}, \ldots, t_{k}\right)$. A mixed ladder determinantal ideal is an ideal of the form $I_{t}(L):=I_{t_{1}}\left(L_{1}\right)+\cdots+I_{t_{k}}\left(L_{k}\right)$. We call mixed ladder determinantal variety a variety defined by a mixed ladder determinantal ideal. As for ladder determinantal varieties, if $I_{V}=I_{t}(L)$ then $V$ is a subvariety of $\mathbb{P}^{r}=\operatorname{Proj}(K[L])$.

Remark 1.5. In Theorem 1.18 we show that every mixed ladder determinantal ideal is prime. Therefore every mixed ladder determinantal ideal is the ideal of a mixed ladder determinantal variety. Moreover, mixed ladder determinantal varieties are irreducible.
Remark 1.6. Every ladder determinantal variety is a mixed ladder determinantal variety, whose vector $t$ has all equal entries.

We adopt the following conventions on the ladder $L$. All of the assumptions can be made without loss of generality.
Assumption 1. All the entries of $L$ are involved in some $t$-minor. Otherwise we delete the superfluous entries. It is easy to check that the resulting set is again a ladder.
Assumption 2. No two consecutive corners coincide; no two upper outside corners belong to the same row or to the same column.

Assumption 3. $I_{t_{i}}\left(L_{i}\right) \nsubseteq I_{t_{j}}\left(L_{j}\right)$ for $i \neq j$. Therefore

$$
d_{j+1}-d_{j}>t_{j+1}-t_{j} \quad \text { and } \quad c_{j+1}-c_{j}>t_{j}-t_{j+1}
$$

In particular, if $c_{j}=c_{j+1}$ then $t_{j}<t_{j+1}$. If $d_{j}=d_{j+1}$, then $t_{j}>t_{j+1}$.
We allow disconnected ladders, i.e. ladders for which $L_{i} \cap L_{i+1}=\emptyset$ for some $i$. We also allow ladders that are contained in a proper submatrix of $X$ (i.e. we do not distinguish between mixed ladder determinantal varieties and cones over them). This is necessary in our context, since in some of the arguments we will need to delete some entries of a ladder (see e.g. Proposition 1.20 and Theorem 2.1). So even if we start with a ladder $L$ that is connected and that is not contained in any proper submatrix of $X$, these properties will not always be preserved.

Notice that Assumption 1 is not necessarily verified by the subladders $L_{j}$, even if it is verified by $L$. Assumption 2 is automatically verified by the subladders $L_{j}$. Assumption 3 is trivially verified by every $L_{j}$, since they have exactly one lower outside corner $\left(d_{j}, c_{j}\right)$ and all the minors have the same size $t_{j}$.

In Section 2 we show that mixed ladder determinantal varieties belong to the Gbiliaison class of a complete intersection. Prior to that, we need to establish some properties of mixed ladder determinantal varieties, such as irreducibility and CohenMacaulayness. Irreducibility of ladder determinantal varieties was proven by Narasimhan in [10], while irreducibility of mixed ladder determinantal varieties associated to one-sided ladders was proven by Gonciulea and Miller in [4]. Cohen-Macaulayness of ladder determinantal varieties was established by Herzog and Trung in [HT92]. The analogous result for mixed ladder determinantal varieties associated to one-sided ladders was proven by Gonciulea and Miller in [4].

In this section we compute the codimension of mixed ladder determinantal varieties. Analogous results were proven by Herzog and Trung (for ladder determinantal varieties) and by Gonciulea and Miller (for mixed ladder determinantal varieties associated to onesided ladders) in the papers mentioned above. In order to compute the codimension, we compute a Gröbner basis of mixed ladder determinantal ideals with respect to a skewdiagonal monomial order.

Notation 1.7. We consider the lexicographic order on the monomials of $R$, induced by the total order < on the variables:

$$
x_{d, c}<x_{b, a} \quad \text { if } b<d \quad \text { or } b=d, a>c .
$$

The leading term of a minor with respect to this term order is the product of the elements on its skew-diagonal.

For $f \in K[L]$ we denote by $\operatorname{LT}(f)$ the leading term of $f$ with respect to $<$. For an ideal $I \subset K[L]$ we denote $\operatorname{LT}(I)$ the leading term ideal of $f$ with respect to $<$.

We now compute a Gröbner basis of $I_{t}(L)$ with respect to the monomial order $<$. We will use this Gröbner basis to compute the height of the mixed ladder determinantal ideal $I_{t}(L)$. The argument is a standard one, see for example [3] and [4]. We first recall two known results.

Lemma 1.8. ([2], Lemma 1.3.13) Let $I \subset K[X]$ be an ideal with Gröbner basis $G$. Let $L \subseteq X$ have the property that if $f \in G$ and $L T(f) \in K[L]$, then $f \in K[L]$. Then $G \cap K[L]$ is a Gröbner basis of $I \cap K[L]$.

Lemma 1.9. ([2], Lemma 1.3.14) Let $I, J \subset K\left[x_{1}, \ldots, x_{r}\right]$ be homogeneous ideals. Let $F$ be a Gröbner basis of $I$ and $G$ be a Gröbner basis of $J$. Then: $F \cup G$ is a Gröbner basis of $I+J$ if and only if for all $f \in F$ and $g \in G$ there is an $h \in I \cap J$ such that $L T(h)=\operatorname{lcm}(L T(f), L T(g))$.

In the next theorem we produce a Gröbner basis of $I_{t}(L)$ with respect to $<$.
Theorem 1.10. Let $\mathcal{G}_{j}$ be the set of determinants of the $t_{j} \times t_{j}$ submatrices of $L_{j}$, such that at most $t_{i}-1$ rows belong to $L_{i}$ for $1 \leq i<j$ and at most $t_{i}-1$ columns belong to $L_{i}$ for $j \leq i<k$. Let $\mathcal{G}=\cup_{j=1}^{k} \mathcal{G}_{j}$. Then $\mathcal{G}$ is a Gröbner basis of $I_{t}(L)$ with respect to $<$.

Proof. The $t_{j} \times t_{j}$ minors of $L_{j}$ that do not belong to $\mathcal{G}_{j}$ can be written as a combination of the minors of $\mathcal{G}_{i}$ for some $i \neq j$. Therefore, $\mathcal{G}$ generates $I_{t}(L)$. Let $\mathcal{F}_{j}$ be the set of $t_{j} \times t_{j}$ minors in $L_{j}, \mathcal{F}_{j} \supseteq \mathcal{G}_{j}$. Moreover for each $f \in \mathcal{F}_{j} \backslash \mathcal{G}_{j}, \operatorname{LT}(f)$ is a multiple of $\operatorname{LT}(g)$ for some $g \in \mathcal{G}_{i}, i \neq j$. Let $\mathcal{F}=\cup_{j=1}^{k} \mathcal{F}_{j}$. From what we just observed, if $\mathcal{F}$ is a Gröbner basis of $I_{t}(L)$, then $\mathcal{G}$ is a Gröbner basis of $I_{t}(L)$ as well.

In order to prove that $\mathcal{F}$ is a Gröbner basis, we proceed by induction on $k$. If $k=1$ then $L$ is a one-sided ladder, $\mathcal{F}=\mathcal{G}$, and the thesis follows from Corollary 3.3 of [10].

If $k=2$, then $L=L_{1} \cup L_{2}$. Let $\left(d_{1}, 1\right),\left(m, c_{2}\right)$ be the lower outside corners of $L$. Let $\left(b_{1}, 1\right),\left(b_{2}, a_{2}\right), \ldots,\left(b_{l}, a_{l}\right)$ be the upper outside corners of $L_{1}$ and let $\left(b_{g}, a_{g}\right), \ldots$, $\left(b_{h-1}, a_{h-1}\right),\left(b_{h}, n\right)$ be the upper outside corners of $L_{2}$. Let $X_{1}$ and $X_{2}$ be as in Notation 1.2. Let $\mathcal{H}_{i}$ be the set of $t_{i} \times t_{i}$ minors contained in $X_{i}, i=1,2$. By Theorem 4.5.4 in [4], $\mathcal{H}_{1} \cup \mathcal{H}_{2}$ is a Gröbner basis of $I=I_{t_{1}}\left(X_{1}\right)+I_{t_{2}}\left(X_{2}\right)$. By Lemma $1.8\left(\mathcal{H}_{1} \cup \mathcal{H}_{2}\right) \cap K[L]$ is a Gröbner basis of $I \cap K[L]$. The assumption of the lemma holds because the leading term of each monomial is the product of the elements on the skew-diagonal, and since $L$ is a ladder. We claim that $\mathcal{F}_{1} \cup \mathcal{F}_{2}=\left(\mathcal{H}_{1} \cup \mathcal{H}_{2}\right) \cap K[L]$. In fact,

$$
\mathcal{F}_{i}=\mathcal{H}_{i} \cap K\left[L_{i}\right]=\mathcal{H}_{i} \cap K[L]
$$

for $i=1,2$. Since $\mathcal{F}=\mathcal{F}_{1} \cup \mathcal{F}_{2}$ generates $I_{t}(L)$, it is a Gröbner basis of it.
Assume that the thesis is true for $k-1$. Let $L^{\prime}=\cup_{j=1}^{k-1} L_{j} ; L^{\prime}$ has lower outside corners $\left(d_{1}, c_{1}\right), \ldots,\left(d_{k-1}, c_{k-1}\right)$. Let $t^{\prime}=\left(t_{1}, \ldots, t_{k-1}\right)$. Then

$$
L=L^{\prime} \cup L_{k} \quad \text { and } \quad I_{t}(L)=I_{t^{\prime}}\left(L^{\prime}\right)+I_{t_{k}}\left(L_{k}\right)
$$

$\mathcal{F}_{k}$ is a Gröbner basis of $I_{t_{k}}\left(L_{k}\right)$ by Corollary 3.3 of [10]. Let $\mathcal{F}^{\prime}=\cup_{j=1}^{k-1} \mathcal{F}_{j}$. By induction hypothesis $\mathcal{F}^{\prime}$ is a Gröbner basis of $I_{t^{\prime}}\left(L^{\prime}\right)$. Moreover, $\mathcal{F}=\mathcal{F}^{\prime} \cup \mathcal{F}_{k}$. Let $f \in \mathcal{F}^{\prime}$ and $g \in \mathcal{F}_{k}$. Then $f \in \mathcal{F}_{j}$ for some $1 \leq j \leq k-1$. Let $H=L_{j} \cup L_{k}$. We have seen above that $\mathcal{F}_{j} \cup \mathcal{F}_{k}$ is a Gröbner basis of $I_{\left(t_{j}, t_{k}\right)}(H)=I_{t_{j}}\left(L_{j}\right)+I_{t_{k}}\left(L_{k}\right)$. Then by Lemma 1.9 there is an $h \in I_{t_{j}}\left(L_{j}\right) \cap I_{t_{k}}\left(L_{k}\right) \subseteq I_{t^{\prime}}\left(L^{\prime}\right) \cap I_{t_{k}}\left(L_{k}\right)$ such that $\operatorname{LT}(h)=\operatorname{lcm}(\operatorname{LT}(f), \operatorname{LT}(g))$. Therefore, $\mathcal{F}=\mathcal{F}^{\prime} \cup \mathcal{F}_{k}$ is a Gröbner basis of $I_{t}(L)$, again by Lemma 1.9.

We now use Theorem 1.10 to compute the height of mixed ladder determinantal ideals. In Theorem 1.15 we produce a subladder $L^{\prime}$ of $L$ such that the number of entries in $L^{\prime}$ equals the height of $I_{t}(L)$. We start by fixing the notation.
Notation 1.11. For $1 \leq i \leq j \leq k$ we define

$$
L_{i, j}=\left(L_{i} \backslash L_{i-1}\right) \cap\left(L_{j} \backslash L_{j+1}\right) .
$$

We adopt the convention that $L_{-1}=L_{k+1}=\emptyset$. Each $L_{i, j}$ is a one-sided ladder with exactly one lower outside corner. Some of the $L_{i, j}$ 's may be empty. Set

$$
t_{i, j}=\min \left\{t_{l} \mid L_{i, j} \subseteq L_{l}\right\}
$$

If $L_{i, j}=\emptyset$, we set $t_{i, j}=1$.
Remark 1.12. It is easy to check that $\cup_{i, j} L_{i, j}=L$, and that $L_{i, j} \cap L_{p, q} \neq \emptyset$ if and only if $(i, j)=(p, q)$.

Moreover, one has the following inequalities between the $t_{i, j}$ 's.
Lemma 1.13. With the notation above, one has

$$
t_{i, j-1} \geq t_{i, j} \quad \text { and } \quad t_{i, j} \geq t_{i-1, j}
$$

whenever $L_{i, j}, L_{i, j-1}, L_{i-1, j} \neq \emptyset$. For all $i, j$ one has $t_{i, j} \geq 1$.
Proof. $t_{i, j} \geq 1$ for all $i, j$ since $t_{l} \geq 1$ for $l=1, \ldots, k$. If $L_{i, j}=\emptyset$, then $t_{i, j}=1$ by definition. The other inequalities follow from the observation that

$$
L_{i, j}=\left(L_{i} \backslash \bigcup_{l=1}^{i-1} L_{l}\right) \bigcap\left(L_{j} \backslash \bigcup_{l=j+1}^{k} L_{l}\right)
$$

We are now ready to construct a subset $\mathcal{B} \subseteq L$, whose cardinality agrees with the dimension of the mixed ladder determinantal variety defined by $I_{t}(L) \subset K[L]$.

Theorem 1.14. Let $\mathcal{B}_{i, j}$ be the subset of $L_{i, j}$ consisting of the elements that belong to the first $t_{i, j-1}-t_{i, j}$ columns or to the last $t_{i, j}-t_{i-1, j}$ rows. Let $\mathcal{B}=\cup_{i, j} \mathcal{B}_{i, j}$. Then

$$
\text { ht } I_{t}(L)=|L \backslash \mathcal{B}| .
$$

Proof. It is well known that ht $I_{t}(L)=$ ht $\operatorname{LT}\left(I_{t}(L)\right)$. Moreover ht $\operatorname{LT}\left(I_{t}(L)\right)=|\mathcal{S}|$, where $\mathcal{S}$ is a subset of the indeterminates in $L$ of minimal cardinality among those with the

Property 1. Each monomial in a set of generators of $\operatorname{LT}\left(I_{t}(L)\right)$ contains a variable from $\mathcal{S}$.

Geometrically, $\operatorname{LT}\left(I_{t}(L)\right)$ corresponds to an intersection $\mathcal{U}$ of linear spaces, and the indeterminates in $\mathcal{S}$ cut out a linear space of minimal codimension among those which contain $\mathcal{U}$ (that therefore has the same codimension as $\mathcal{U}$ ). We claim that $L \backslash \mathcal{B}$ is a subset of $L$ with the Property 1. In fact, we can choose as a set of generators for $\operatorname{LT}\left(I_{t}(L)\right)$ the set of all skew-diagonal terms of $t_{j} \times t_{j}$ minor in $L_{j}$. Notice moreover that $t_{j} \geq t_{i, j}$ and that $L_{i, j} \backslash \mathcal{B}_{i, j} \neq \emptyset$ if $L_{i, j} \neq \emptyset$.

In order to complete the proof, we need to show that any $\mathcal{S}^{\prime}$ with $\left|\mathcal{S}^{\prime}\right|<|L \backslash \mathcal{B}|$ does not satisfy the Property 1. Let $\mathcal{S}=L \backslash \mathcal{B}$, and let

$$
\delta_{u}=\left\{x_{b, a} \in L \mid b+a=u+1\right\}, u \geq 1
$$

Then $L=\cup_{u \geq 1} \delta_{u}$ and each two distinct elements in the union are disjoint. Since

$$
\sum_{u \geq 1}\left|\mathcal{S} \cap \delta_{u}\right|=|\mathcal{S}|>\left|\mathcal{S}^{\prime}\right|=\sum_{u \geq 1}\left|\mathcal{S}^{\prime} \cap \delta_{u}\right|
$$

then $\left|\mathcal{S} \cap \delta_{u}\right|>\left|\mathcal{S}^{\prime} \cap \delta_{u}\right|$ for some $u \geq 1$. Notice that if $\delta_{u} \cap L_{j} \neq \emptyset$, then $\delta_{u} \subseteq L_{j}$. This follows from the definition of ladder. So let $j$ be maximum with the property that $\mathcal{S} \cap \delta_{u} \subseteq L_{j}$. Then

$$
\left|\mathcal{S}^{\prime} \cap \delta_{u} \cap L_{j}\right| \leq\left|\mathcal{S}^{\prime} \cap \delta_{u}\right|<\left|\mathcal{S} \cap \delta_{u}\right|=\left|L_{j} \cap \delta_{u}\right|-\left|\left(\mathcal{S} \backslash L_{j}\right) \cap \delta_{u}\right|=\left|L_{j} \cap \delta_{u}\right|-\left(t_{j}-1\right)
$$

Therefore there are $t_{j}$ distinct variables in $\left(\delta_{u} \cap L_{j}\right) \backslash \mathcal{S}^{\prime}$. Their product corresponds to a minimal generator of $\operatorname{LT}\left(I_{t}(L)\right)$ that does not involve any element of $\mathcal{S}^{\prime}$.

We now construct a subladder $L^{\prime}$ of $L$ such that the number of entries in $L^{\prime}$ equals the height of $I_{t}(L)$.
Theorem 1.15. Let $L$ be a ladder with upper outside corners and lower outside corners as in Notation 1.2. Let $L^{\prime}$ be the sublattice with the same upper outside corners as $L$, and lower outside corners $\left\{\left(d_{j}-t_{j}+1, c_{j}+t_{j}-1\right) \mid 1 \leq j \leq k\right\}$. Then

$$
h t I_{t}(L)=\left|L^{\prime}\right| .
$$

Proof. First notice that $L^{\prime}$ is a ladder, since the coordinates of its outside lower corners verify the inequalities

$$
\begin{equation*}
d_{j+1}-t_{j+1}+1>d_{j}-t_{j}+1 \quad \text { and } \quad c_{j+1}+t_{j+1}-1>c_{j}+t_{j}-1 \tag{1}
\end{equation*}
$$

by Assumption 3. Notice that it follows from (1) that no two outside lower corners of $L^{\prime}$ belong to the same row or column. Let $\mathcal{M}$ be the set of minors in $\mathcal{G}$ that involve consecutive rows and columns (see the statement of Theorem 1.10 for the definition of $\mathcal{G}$ ).
Claim 1. $|\mathcal{M}|=|L \backslash \mathcal{B}|$.
There is a bijection between the two sets, given by the fact that every minor in $\mathcal{M}$ corresponds uniquely to its lower left corner.

Claim 2. $|\mathcal{M}|=\left|L^{\prime}\right|$.
Again, there is a bijection between the two sets. Every minor in $\mathcal{M}$ corresponds uniquely to its upper right corner. The two claims together with Theorem 1.14 prove the thesis.

Remark 1.16. Theorem 1.15 also follows from the observation that for each $1 \leq i \leq h$ and $1 \leq j \leq k$ such that $L_{i, j} \neq \emptyset$, we delete $r_{i, j}=t_{i, j}-t_{i-1, j}$ rows and $c_{i, j}=t_{i, j-1}-t_{i, j}$ columns from $L_{i, j}$. Therefore, the total number of entries deleted from a row that belongs to $L_{i} \backslash L_{i-1}$ is

$$
\sum_{j: L_{i, j} \neq \emptyset} c_{i, j}=\sum_{j: L_{i, j} \neq \emptyset}\left(t_{i, j}-t_{i-1, j}\right)=t_{i}-1 .
$$

Similarly, the total number of entries deleted from a column that belongs to $L_{j} \backslash L_{j+1}$ is

$$
\sum_{i: L_{i, j} \neq \emptyset} r_{i, j}=\sum_{i: L_{i, j} \neq \emptyset}\left(t_{i, j-1}-t_{i, j}\right)=t_{j}-1 .
$$

Remark 1.17. In Theorem 2.1 we show that if $V$ is a mixed ladder determinantal variety with $I_{V}=I_{t}(L)$, then $V$ is G-bilinked in $t_{1}+\cdots+t_{k}-k$ steps to the linear variety associated to $I_{1}\left(L^{\prime}\right)$.

Following the proof of Theorem 4.1 in [10], we can show that mixed ladder determinantal ideals are prime. Hence they define irreducible projective varieties.

Theorem 1.18. Let $X_{i} \subseteq X$ be as in Notation 1.2. Let $X^{\prime}=X_{1} \cup \ldots \cup X_{k}$ and let $I_{t}\left(X^{\prime}\right)=I_{t_{1}}\left(X_{1}\right)+\cdots+I_{t_{k}}\left(X_{k}\right) \subseteq K\left[X^{\prime}\right]$. Then

$$
I_{t}\left(X^{\prime}\right) \cap K[L]=I_{t}(L)
$$

In particular, $I_{t}(L)$ is a prime ideal.
Proof. It is enough to show that $I_{t}\left(X^{\prime}\right) \cap K[L] \subseteq I_{t}(L)$. For $j=1, \ldots, k$, let $\mathcal{G}_{j}$ be the set of determinants of the $t_{j} \times t_{j}$ submatrices of $X_{j}$, such that at most $t_{i}-1$ rows belong to $X_{i}$ for $1 \leq i<j$ and at most $t_{i}-1$ columns belong to $X_{i}$ for $j \leq i<k$. Let $\mathcal{G}=\cup_{j=1}^{k} \mathcal{G}_{j}$. By Theorem $1.10 \mathcal{G}$ is a Gröbner basis of $I_{t}\left(X^{\prime}\right)$ with respect to $<$. Let $f \in I_{t}\left(X^{\prime}\right) \cap K[L]$ be a homogeneous form. Then

$$
f=\mathrm{LT}(f)+g=\mathrm{LT}(m) h+g
$$

where $g=f-\operatorname{LT}(f), \operatorname{LT}(m)$ is the leading term of some element $m \in \mathcal{G}$, and $h \in K[L]$ is a monomial (possibly multiplied by a constant). Then

$$
f=m h+f^{\prime}
$$

where $f^{\prime}=f-m h \in I_{t}\left(X^{\prime}\right) \cap K[L], \operatorname{deg}(f)=\operatorname{deg}\left(f^{\prime}\right)$ and $\operatorname{LT}\left(f^{\prime}\right)<\operatorname{LT}(f)$. The proof is complete by induction on $\operatorname{LT}(f)$.

Any mixed ladder determinantal variety has a nonempty open subset which is isomorphic to a nonempty open subset of a ladder determinantal variety. We prove this in Proposition 1.20, by repeatedly localizing the coordinate ring of the variety at a corner. We need the following lemma.

Lemma 1.19. Let $L$ be a ladder and let $I_{t}(L)$ be a mixed ladder determinantal ideal, as in Notation 1.2. Let $d_{0}=0$ and $c_{k+1}=n+1$. Fix a $j \in\{1, \ldots, k\}$ such that

$$
t_{j}>1, \quad d_{j-1}<d_{j}, \quad c_{j+1}>c_{j}
$$

Let $M$ be the ladder obtained from $L$ by removing the indeterminates

$$
x_{d_{j-1}+1, c_{j}}, \ldots, x_{d_{j}, c_{j}}, x_{d_{j}, c_{j}+1}, \ldots, x_{d_{j}, c_{j+1}-1} .
$$

The ladder $M$ has lower outside corners

$$
\left\{\left(d_{1}, 1\right), \ldots,\left(d_{j-1}, c_{j-1}\right),\left(d_{j}-1, c_{j}+1\right),\left(d_{j+1}, c_{j+1}\right), \ldots,\left(m, c_{k}\right)\right\}
$$

and the same upper outside corners as L. Let $t^{\prime}=\left(t_{1}, \ldots, t_{j-1}, t_{j}-1, t_{j+1}, \ldots, t_{k}\right)$. Then there is an isomorphism

$$
K[L] / I_{t}(L)\left[x_{d_{j}, c_{j}}^{-1}\right] \cong K[M] / I_{t^{\prime}}(M)\left[x_{d_{j-1}+1, c_{j}}, \ldots, x_{d_{j}, c_{j}}, x_{d_{j}, c_{j}+1}, \ldots, x_{d_{j}, c_{j-1}-1}\right]\left[x_{d_{j}, c_{j}}^{-1}\right] .
$$

Proof. Define

$$
\varphi: K[L]\left[x_{d_{j}, c_{j}}^{-1}\right] \longrightarrow K[M]\left[x_{d_{j-1}+1, c_{j}}, \ldots, x_{d_{j}, c_{j}}, x_{d_{j}, c_{j}+1}, \ldots, x_{d_{j}, c_{j+1}-1}\right]\left[x_{d_{j}, c_{j}}^{-1}\right]
$$

by the assignment

$$
\varphi\left(x_{u, v}\right)= \begin{cases}x_{u, v}+x_{u, c_{j}} x_{d_{j}, v} x_{d_{j}, c_{j}}^{-1} & \text { if } u \neq d_{j}, v \neq c_{j} \text { and } x_{u, v} \in L_{j} \\ x_{u, v} & \text { otherwise }\end{cases}
$$

The inverse of $\varphi$ is

$$
\psi: K[M]\left[x_{d_{j-1}+1, c_{j}}, \ldots, x_{d_{j}, c_{j}}, x_{d_{j}, c_{j}+1}, \ldots, x_{d_{j}, c_{j+1}-1}\right]\left[x_{d_{j}, c_{j}}^{-1}\right] \longrightarrow K[L]\left[x_{d_{j}, c_{j}}^{-1}\right]
$$

defined by the assignment

$$
\psi\left(x_{u, v}\right)= \begin{cases}x_{u, v}-x_{u, c_{j}} x_{d_{j}, v} x_{d_{j}, c_{j}}^{-1} & \text { if } u \neq d_{j}, v \neq c_{j} \text { and } x_{u, v} \in M_{j}, \\ x_{u, v} & \text { otherwise } .\end{cases}
$$

Let

$$
J_{t}(L)=I_{t}(L) K[L]\left[x_{d_{j}, c_{j}}^{-1}\right]
$$

and

$$
J_{t^{\prime}}(M)=I_{t^{\prime}}(M) K[M]\left[x_{d_{j-1}+1, c_{j}}, \ldots, x_{d_{j}, c_{j}}, x_{d_{j}, c_{j}+1}, \ldots, x_{d_{j}, c_{j+1}-1}\right]\left[x_{d_{j}, c_{j}}^{-1}\right] .
$$

It suffices to show that $\varphi\left(J_{t}\left(L_{j}\right)\right)=J_{t^{\prime}}\left(M_{j}\right)$ for $1 \leq j \leq k$, where $M_{j}=L_{j} \cap M$. Since $L_{j}$ is a one-sided ladder, the thesis follows from Lemma 5.1.4 in [4].

Proposition 1.20. Let $I_{t}(L)$ be a mixed ladder determinantal ideal as in Notation 1.2. Let

$$
t_{\max }=\max \left\{t_{1}, \ldots, t_{k}\right\}, \quad t_{\min }=\min \left\{t_{1}, \ldots, t_{k}\right\}
$$

Let $L_{\max }$ be the ladder obtained from $L$ by enlarging each $L_{j}$ along its lower border by a strip of $t_{\max }-t_{j}$ new indeterminates. In other words, $L_{\max }$ has the same upper outside corners as $L$, and lower outside corners $\left\{\left(d_{j}+\left(t_{\max }-t_{j}\right), c_{j}-\left(t_{\max }-t_{j}\right)\right)\right\}$. Let $L_{\min }$ be the ladder obtained from $L$ by removing from each $L_{j}$ along its lower border a strip of $t_{j}-t_{\min }$ indeterminates. In other words, $L_{\min }$ has the same upper outside corners as $L$, and lower outside corners $\left\{\left(d_{j}-\left(t_{j}-t_{\min }\right), c_{j}+\left(t_{j}-t_{\min }\right)\right)\right\}$. Let $I_{\max }=I_{t_{\max }}\left(L_{\max }\right)$
and $I_{\min }=I_{t_{\min }}\left(L_{\min }\right)$. Then there are $u \in K\left[L_{\max }\right] / I_{t_{\max }}\left(L_{\max }\right)$, $v \in K[L] / I_{t}(L)$, and indeterminates $w_{1}, \ldots, w_{i}, z_{1}, \ldots, z_{j}$ such that

$$
K\left[L_{\max }\right] / I_{\max }\left[u^{-1}\right] \cong K[L] / I_{t}(L)\left[w_{1}, \ldots, w_{i}\right]\left[w_{1}^{-1}, \ldots, w_{i_{0}}^{-1}\right]
$$

and

$$
K\left[L_{\min }\right] / I_{\min }\left[z_{1}, \ldots, z_{j}\right]\left[z_{1}^{-1}, \ldots, z_{j_{0}}^{-1}\right] \cong K[L] / I_{t}(L)\left[v^{-1}\right]
$$

for some $i_{0} \leq i$ and $j_{0} \leq j$.
Proof. The thesis easily follows from Lemma 1.19. We sketch how it can be derived from it. In order to prove the first of the two ring isomorphisms, keep localizing the ring $K\left[L_{\max }\right] / I_{\max }$ at the indeterminates in the appropriate lower outside corners of $L_{\max }$. The size of the minors considered in each region decreases by 1 at each localization, and by Lemma 1.19 we have an isomorphism as claimed. A similar argument can be made starting from $K[L] / I_{t}(L)$. The products of the elements that were inverted give $u$ and $v$, respectively.

We now prove that $I_{t}(L)$ defines an arithmetically Cohen-Macaulay variety.
Theorem 1.21. Mixed ladder determinantal ideals are Cohen-Macaulay.
Proof. Let $I_{t}(L)$ be a mixed ladder determinantal ideal. We follow the Notation 1.2. Let $t_{\max }, t_{\min }, L_{\max }, L_{\min }$ be as in Proposition 1.20. Let $I_{\max }=I_{t_{\max }}\left(L_{\max }\right)$ and $I_{\min }=$ $I_{t_{\text {min }}}\left(L_{\text {min }}\right)$. We saw that

$$
K\left[L_{\max }\right] / I_{\max }\left[u^{-1}\right] \cong K[L] / I_{t}(L)\left[w_{1}, \ldots, w_{i}\right]\left[w_{1}^{-1}, \ldots, w_{i_{0}}^{-1}\right]
$$

and

$$
K\left[L_{\min }\right] / I_{\min }\left[z_{1}, \ldots, z_{j}\right]\left[z_{1}^{-1}, \ldots, z_{j_{0}}^{-1}\right] \cong K[L] / I_{t}(L)\left[v^{-1}\right] .
$$

The rings $K\left[L_{\max }\right] / I_{\max }$ and $K\left[L_{\min }\right] / I_{\min }$ are Cohen-Macaulay by Corollary 4.10 in [HT92]. So the thesis follows from the observation that a ring $S$ is Cohen-Macaulay if and only if $S[x]$ is Cohen-Macaulay.

In Theorem 5.2 of [3], Conca classifies the arithmetically Gorenstein ladder determinantal varieties associated to one-sided ladders, or to two-sided ladders satisfying a numerical condition. Using the result of Conca, Gonciulea and Miller classify the arithmetically Gorenstein mixed ladder determinantal varieties associated to one-sided ladders (see Theorem 6.3.1 of [4]). Using the same result of Conca together with Proposition 1.20, we can characterize the arithmetically Gorenstein mixed ladder determinantal varieties among those with the Property 2 below.

Notation 1.22. Let $L$ be a ladder as in Notation 1.2. Let $t_{\max }=\max \left\{t_{1}, \ldots, t_{k}\right\}$. Let $\tau \geq 2$ be an integer. We denote by $L_{\tau}$ a ladder with the same upper outside corners as $L$, and lower outside corners $\left\{\left(d_{j}+\left(\tau-t_{j}\right), c_{j}-\left(\tau-t_{j}\right)\right)\right\}$.

In other words, $L_{\tau}$ is the ladder obtained from $L$ by deleting (resp. adding) $t_{j}-\tau$ (resp. $\tau-t_{j}$ ) rows and columns from the $j$-th lower step if $\tau \leq t_{j}$ (resp. $\tau \geq t_{j}$ ).

The same argument as in the proof of Proposition 1.20 shows the following.

Theorem 1.23. Let $I_{t}(L)$ be a mixed ladder determinantal ideal as in Notation 1.2. Let $\tau \geq 2$ be an integer, and let $L_{\tau}$ be as in Notation 1.22. Then there are $u \in K\left[L_{\tau}\right] / I_{\tau}\left(L_{\tau}\right)$, $v \in K[L] / I_{t}(L)$, and indeterminates $w_{1}, \ldots, w_{i}, z_{1}, \ldots, z_{j}$ such that

$$
K\left[L_{\tau}\right] / I_{\tau}\left(L_{\tau}\right)\left[w_{1}, \ldots, w_{i}\right]\left[w_{1}^{-1}, \ldots, w_{i_{0}}^{-1}, u^{-1}\right] \cong K[L] / I_{t}(L)\left[z_{1}, \ldots, z_{i}\right]\left[z_{1}^{-1}, \ldots, z_{j_{0}}^{-1}, v^{-1}\right]
$$

for some $i_{0} \leq i$ and $j_{0} \leq j$.
In Theorem 1.25 we characterize Gorensteinness for mixed ladder determinantal rings which satisfy the following condition.
Property 2. There exists $\tau \geq 2$ such that the ladder $L_{\tau}$ is connected and

$$
\min _{i}\left\{a_{i+1}-a_{i}, b_{i+1}-b_{i}, c_{i+1}+t_{i+1}-c_{i}-t_{i}, d_{i+1}-t_{i+1}-d_{i}+t_{i}\right\}>\tau-2
$$

Remarks 1.24. - If the minimum condition is satisfied for $\tau$, then it is satisfied for $\tau-1$ as well. However, $L_{\tau-1}$ may be disconnected even when $L_{\tau}$ is connected.

Equivalently, observe that for $\tau \gg 0$ the ladder $L_{\tau}$ is connected. However, the truth value of the minimum condition may change passing from a smaller value of $\tau$ to a larger one.

- If no two corners of $L_{2}$ belong to the same row or to the same column, then the minimum condition is automatically verified. If in addition $L_{2}$ is connected, then $L$ satisfies Property 2.

We are now ready to give a numerical criterion to decide whether the ring $K[L] / I_{t}(L)$ is Gorenstein, for a ladder $L$ that satisfies Property 2.

Theorem 1.25. Let $L$ be a ladder satisfying Property 2. Then $I_{t}(L)$ is Gorenstein if and only if all of the following hold:

- $m-t_{k}=n-t_{1}$,
- $c_{j+1}-d_{j}=2+t_{1}-t_{j}-t_{j+1}$ for $j=1, \ldots, k-1$,
- $a_{i}-b_{i+1}=t_{1}-2$ for $i=1, \ldots, h-1$.

Proof. Let $I_{t}(L)$ be a mixed ladder determinantal ideal. We follow the Notation 1.2. Let $L_{\tau}$ be as in Property 2, and $I=I_{\tau}\left(L_{\tau}\right)$. By Theorem 1.23

$$
K\left[L_{\tau}\right] / I\left[w_{1}, \ldots, w_{i}\right]\left[z_{1}^{-1}, \ldots, z_{j_{0}}^{-1}, u^{-1}\right] \cong K[L] / I_{t}(L)\left[z_{1}, \ldots, z_{i}\right]\left[w_{1}^{-1}, \ldots, w_{i_{0}}^{-1}, v^{-1}\right] .
$$

By Theorem 5.2 of [3], the ring $K\left[L_{\tau}\right] / I$ is Gorenstein if and only if $X_{\tau}$ is a square matrix, and the inside lower corners (resp. inside upper corners) lie on certain diagonals. Here $X_{\tau}$ is the smallest matrix containing $L_{\tau}$. The numerical conditions in [3] translate into the conditions in our thesis. Notice moreover that Assumption 3 guarantees that no two consecutive corners of $L_{\tau}$ belong to the same row or to the same column. So the thesis follows from the observation that a ring $S$ is Gorenstein if and only if $S[x]$ is Gorenstein.

Remark 1.26. It is natural that the conditions of Theorem 1.25 are independent of $\tau$. The requirement that Property 2 holds for some $\tau$ is required in order to apply Theorem 5.2 of [3]. However, Gorensteinness is independent of $\tau$. In fact, by Lemma 1.19 either the ideals $I_{\tau}\left(L_{\tau}\right)$ are Gorenstein for every choice of $\tau$, or none of them is Gorenstein.

## 2. Linkage of mixed ladder determinantal varieties

In this section we prove that any mixed ladder determinantal variety can be obtained from a linear variety by a finite sequence of ascending elementary G-biliaisons. The biliaisons are performed on mixed ladder determinantal varieties, which are irreducible, hence generically Gorenstein. Therefore we conclude that mixed ladder determinantal varieties are glicci. In the end of the section, we sketch how one can show that the same conclusions hold for a mixed ladder determinantal variety associated to a matrix of generic forms.

The next theorem is the main result of this paper. It is analogous to Gaeta's Theorem, to Theorem 3.6 of [7], and to Theorem 4.1 of [6]. It is also analogous to Theorem 2.3 of [5] for a matrix that is not symmetric. The idea of the proof is as follows: starting from a mixed ladder determinantal variety $V$, we construct two more mixed ladder determinantal varieties $V^{\prime}$ and $W$ such that $V$ and $V^{\prime}$ are generalized divisors on $W$. We show that $V^{\prime}$ can be obtained from $V$ by an elementary G-biliaison on $W$.

Theorem 2.1. Any mixed ladder determinantal variety in $\mathbb{P}^{r}$ can be obtained from a linear variety by a finite sequence of ascending elementary biliaisons.

Proof. Let $V \subset \mathbb{P}^{r}=\operatorname{Proj}(K[L])$ be a mixed ladder determinantal variety. We follow the Notation 1.2. Let $L \subseteq X=\left(x_{i, j}\right)$ be the ladder whose minors of size $t=\left(t_{1}, t_{2}, \ldots, t_{k}\right)$ define the variety $V$. In other words, $I_{V}=I_{t_{1}}\left(L_{1}\right)+\cdots+I_{t_{k}}\left(L_{k}\right) \subseteq R=K[L]$.

If $t_{1}=\ldots=t_{k}=1$ then $V$ is a linear variety. Therefore, we concentrate on the case when $t_{i} \geq 2$ for some $i$.

Let $L^{\prime}$ be the subladder of $L$ defined by the lower outside corners

$$
\left\{\left(d_{j}-t_{j}+1, c_{j}+t_{j}-1\right) \mid j=1, \ldots, k\right\}
$$

It follows from Theorem 1.15 that $I_{t}(L)$ defines a variety of codimension $c$ equal to the number of entries in $L^{\prime}$. Fix an $i$ such that $t_{i} \geq 2$ and let $\left(d_{i}, c_{i}\right)$ be the position of the $i$-th lower outside corner of $L$. Let

$$
t^{\prime}=\left(t_{1}, \ldots, t_{i-1}, t_{i}-1, t_{i+1}, \ldots, t_{k}\right)
$$

and let $M$ be the subladder of $L$ defined by the lower outside corners $\left\{\left(\delta_{j}, \gamma_{j}\right) \mid j=\right.$ $1, \ldots, k\}$ :

$$
\left(\delta_{j}, \gamma_{j}\right)= \begin{cases}\left(d_{i}-1, c_{i}+1\right) & \text { if } j=i, \\ \left(d_{j}, c_{j}\right) & \text { if } j \neq i .\end{cases}
$$

Informally, $M$ is obtained from $L$ by removing the last row and the first column from the $i$-th lower step of the ladder $L$ (in the case of consecutive lower outside corners that lie on the same row or column however, one has to be careful about the corners while canceling). Notice that $M$ is a ladder according to Definition 1.2, unless either $d_{i}=d_{i-1}$ or $c_{i}=c_{i+1}$. By Assumption 3, if $d_{i}=d_{i-1}$ then $t_{i-1}>t_{i} \geq 2$. Therefore we can replace $i$ by $i-1$ and construct a new subset $M$ of $L$, starting from the $(i-1)$-th lower outside corner of $L$. The process eventually ends, since the subset $M$ constructed started from the leftmost lower outside corner of $L$ on the row $d_{i}$ is always a ladder. If $c_{i}=c_{i+1}$, then $t_{i+1}>t_{i} \geq 2$. In this case we can replace $i$ by $i+1$ and construct a new subset $M$ of
$L$, starting from the $(i+1)$-th lower outside corner of $L$. The process eventually ends, since the subset $M$ constructed started from the lowest outside lower corner of $L$ on the column $c_{j}$ is always a ladder. Summarizing, we have shown that starting from a ladder $L$ with $t_{j} \geq 2$ for some $j$, we can construct a ladder $M \subset L$, with $t_{i}^{\prime}=t_{i}-1$ for some $i$ and $t_{j}^{\prime}=t_{j}$ for $j \neq i$.

Again, by Theorem $1.15 I_{t^{\prime}}(M) \subset K[M]$ defines a mixed ladder determinantal variety of codimension $c=$ ht $I_{1}\left(L^{\prime}\right)$. Hence $I_{t^{\prime}}(M) \subset K[L]$ defines a variety $V^{\prime} \subset \mathbb{P}^{r}$ of codimension $c$, which is a cone over a mixed ladder determinantal variety. From now on, we will not distinguish between mixed ladder determinantal varieties and cones over them.

Let $N$ be the ladder obtained from $L$ by removing the entry $x_{d_{i}, c_{i}} . N$ is a ladder, since both $L$ and $M$ are. $N$ has the same upper outside corners as $L, M$, and it has lower outside corners

$$
\left\{\left(d_{1}, c_{1}\right), \ldots,\left(d_{i-1}, c_{i-1}\right),\left(d_{i}-1, c_{i}\right),\left(d_{i}, c_{i}+1\right),\left(d_{i+1}, c_{i-1}\right), \ldots,\left(d_{k}, c_{k}\right)\right\}
$$

Let

$$
\tau=\left(t_{1}, \ldots, t_{i-1}, t_{i}, t_{i}, t_{i+1}, \ldots, t_{k}\right)
$$

be the vector obtained from $t$ by repeating twice the entry $t_{i}$. Let $W$ be the mixed ladder determinantal variety with associated ideal $I_{\tau}(N)$. It follows from Theorems 1.15, 1.18, and 1.21 that $W$ has codimension $c-1$, and is irreducible and arithmetically CohenMacaulay. So $W$ is generically Gorenstein and $V, V^{\prime}$ are generalized divisor on it.

We denote by $H$ a hyperplane section divisor on $W$. We claim that

$$
V \sim V^{\prime}+H
$$

where $\sim$ denotes linear equivalence of divisors on $W$. It follows that $V$ is obtained by an ascending elementary biliaison from $V^{\prime}$. Repeating this argument, after $t_{1}+\cdots+t_{k}-k$ biliaisons we reduce to the case $t_{1}=\ldots=t_{k}=1$. Then the resulting variety is linear, hence we have bilinked $V$ to a linear variety. Notice that the ideal of this linear variety is generated by the entries of $L^{\prime}$, where $L^{\prime}$ is the subladder of $L$ defined in Theorem 1.15.

Let $\mathcal{I}_{V \mid W}, \mathcal{I}_{V^{\prime} \mid W}$ be the ideal sheafs on $W$ of $V$ and $V^{\prime}$. In order to prove the claim we must show that

$$
\begin{equation*}
\mathcal{I}_{V \mid W} \cong \mathcal{I}_{V^{\prime} \mid W}(-1) \tag{2}
\end{equation*}
$$

A minimal system of generators of $I_{V \mid W}=H_{*}^{0}\left(\mathcal{I}_{V \mid W}\right)=I_{t}(L) / I_{\tau}(N)$ is given by the images in the coordinate ring of $W$ of the $t_{i} \times t_{i}$ minors of $L$ that involve the entry $x_{d_{i}, c_{i}}$. To keep the notation simple, we denote both an element of $R$ and its image in $R / I_{W}$ with the same symbol, and we set $t=t_{i}, d=d_{i}, c=c_{i}$. We let a minor $L_{i_{1}, \ldots, i_{t-1}, d ; c, j_{1}, \ldots, j_{t-1}}$, resp. $L_{i_{1}, \ldots, i_{t-1} ; j_{1}, \ldots, j_{t-1}}$, be 0 if it involves one or more entries that do not belong to $L$. Hence we have

$$
I_{V \mid W}=\left(L_{i_{1}, \ldots, i_{t-1}, d ; c, j_{1}, \ldots, j_{t-1}} \mid 1 \leq i_{1}<\ldots<i_{t-1}<d, c<j_{1}<\ldots<j_{t-1} \leq n\right)
$$

A minimal system of generators of $I_{V^{\prime} \mid W}=H_{*}^{0}\left(\mathcal{I}_{V^{\prime} \mid W}\right)=I_{t-1}(M) / I_{t}(N)$ is given by the images in the coordinate ring of $W$ of the minors of $L_{i}$ of size $t_{i}-1$ that do not involve
row $d$ and column $c$ :

$$
I_{V^{\prime} \mid W}=\left(L_{i_{1}, \ldots, i_{t-1} ; j_{1}, \ldots, j_{t-1}} \mid 1 \leq i_{1}<\ldots<i_{t-1}<d, c<j_{1}<\ldots<j_{t-1} \leq n\right)
$$

Notice that with our conventions we have

$$
L_{i_{1}, \ldots, i_{t-1}, d ; c, j_{1}, \ldots, j_{t-1}}=0 \quad \text { if and only if } \quad L_{i_{1}, \ldots, i_{t-1} ; j_{1}, \ldots, j_{t-1}}=0
$$

where $L_{i_{1}, \ldots, i_{t-1}, d ; c, j_{1}, \ldots, j_{t-1}}$ is a generator of $I_{V \mid W}$ and $L_{i_{1}, \ldots, i_{t-1} ; j_{1}, \ldots, j_{t-1}}$ is a generator of $I_{V^{\prime} \mid W}$.

In order to produce an isomorphism as in (2), it suffices to observe that the ratios

$$
\begin{equation*}
\frac{L_{i_{1}, \ldots, i_{t-1}, d ; c, j_{1}, \ldots, j_{t-1}}}{L_{i_{1}, \ldots, i_{t-1} ; j_{1}, \ldots, j_{t-1}}} \tag{3}
\end{equation*}
$$

are all equal as elements of $H^{0}\left(\mathcal{K}_{W}(1)\right)$, where $\mathcal{K}_{W}$ is the sheaf of total quotient rings of $W$. Then the isomorphism (2) is given by multiplication by that element.

Equality of all the ratios in (3) follows from Lemmas 2.4 and 2.6 in [5], where we prove that

$$
L_{i_{1}, \ldots, i_{t-1}, d ; c, j_{1}, \ldots, j_{t-1}} \cdot L_{k_{1}, \ldots, k_{t-1} ; l_{1}, \ldots, l_{t-1}}-L_{k_{1}, \ldots, k_{t-1}, d ; c, l_{1}, \ldots, l_{t-1}} \cdot L_{i_{1}, \ldots, i_{t-1} ; j_{1}, \ldots, j_{t-1}} \in I_{W}
$$

for any choice of $i_{1}, \ldots, i_{t-1}, j_{1}, \ldots, j_{t-1}, k_{1}, \ldots, k_{t-1}, l_{1}, \ldots, l_{t-1}$. This completes the proof of the claim and of the theorem.

Standard results in liaison theory give the following.
Corollary 2.2. Every mixed ladder determinantal variety $V$ can be bilinked in $t_{1}+\ldots+$ $t_{k}-k$ steps to a linear variety of the same codimension. In particular determinantal varieties associated to matrices of indeterminates, ladder determinantal varieties, and mixed ladder determinantal varieties are glicci.

Remark 2.3. In Theorem 1.25 we classify the mixed ladder determinantal varieties which are arithmetically Gorenstein (among those that satisfy Property 2). The fact that arithmetically Gorenstein schemes are glicci follows from a result of Casanellas, Drozd, and Hartshorne (see [1]).

We conclude by noticing that by the upper-semicontinuity principle, one can argue that a generic mixed ladder determinantal scheme is glicci. The idea is as follows: fix $m, n$ and upper and lower outside corners for a ladder $L$, and assume that all the ideals involved in the proof of Theorem 2.1 have maximal height (i.e. the height of the ideal that we would obtain if all the entries in $L$ were distinct indeterminates). This is the case e.g. when the entries of $L$ are generic polynomials in $S=K\left[x_{0}, \ldots, x_{s}\right]$ and $s \gg 0$. Let $T$ be the scheme with saturated ideal $I_{T}=I_{t}(L) \subseteq S$. We call such a scheme a generic mixed ladder determinantal scheme. The proof of Theorem 2.1 can be repeated with no changes for $T$, under the assumption that $T$ is a generic mixed ladder determinantal scheme. Therefore we have the following.

Theorem 2.4. Any generic mixed ladder determinantal scheme can be obtained from a complete intersection by a finite sequence of ascending elementary G-biliaisons. In particular, a generic mixed ladder determinantal scheme is glicci.
